

Flattened ground state: $n_{\text{shell}} = \infty$, large circumferences

$\cdots\blacktriangle\cdots$ $N_y = 40, w = 10$ $\cdots\blacksquare\cdots$ $N_y = 50, w = 12$ $\cdots\bullet\cdots$ $N_y = 60, w = 15$

(a) hard / support-truncated

(b) soft / untruncated

Horizontal lines: $I_{a,b}^{\text{CFT}} = -(1/3)\log[1 - \sin^2(\pi w/N_y)]$; vertical line: $\alpha_1 = 2$.

Open markers at $\alpha_1 = 2$ denote the symmetric critical-grid prescription.
