

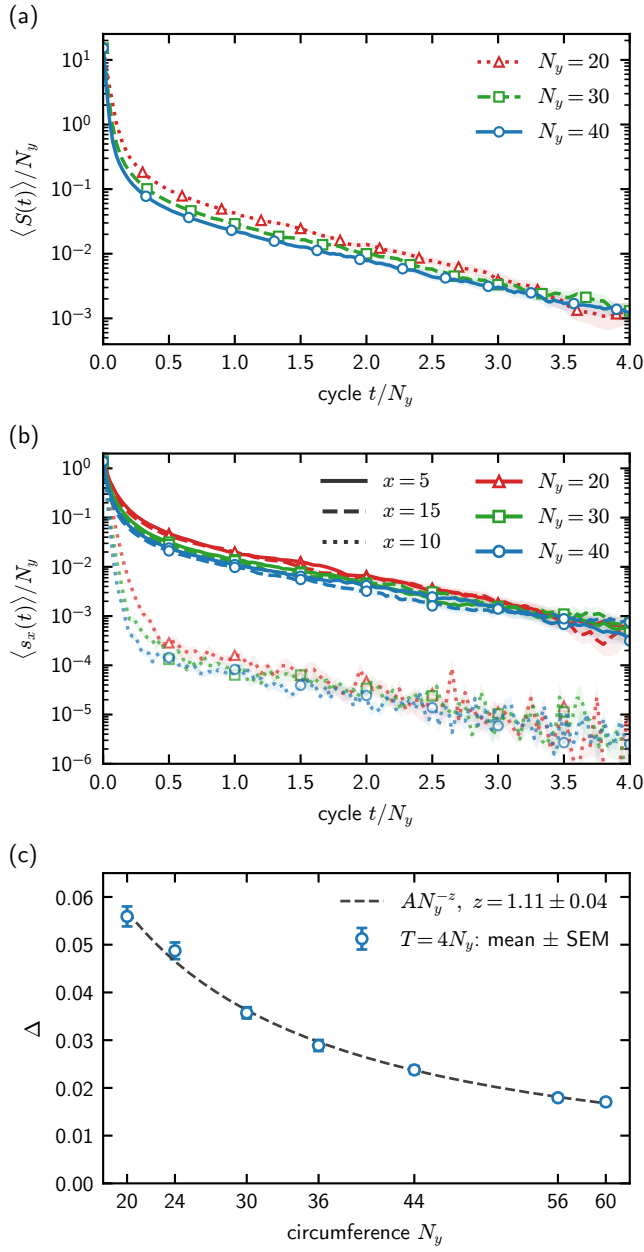

FIG. 1. Hard-wall purification and endpoint Lyapunov gap. Panels (a,b): 100 independent trajectories per size, $N_y = 20, 30, 40$, from bundle 07. Panel (c): bundle-13 endpoints at $T = 4N_y$, with sample SEM and the weighted power-law fit $\Delta \propto N_y^{-1.11 \pm 0.04}$. See the accompanying README for the full estimator and sampling definitions.
