

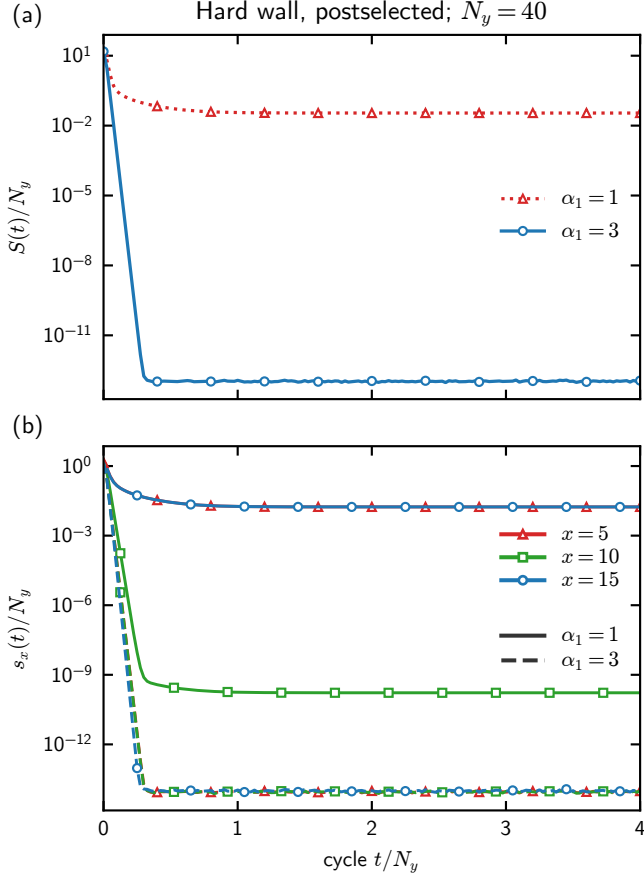

FIG. 1. Hard-wall postselected purification at $N_x = 20$, $N_y = 40$, $\alpha_2 = 30$, $n_{\text{shell}} = 1$, and $T = 160$ cycles. Each $\alpha_1 = 1, 3$ run is a single fully postselected trajectory from a maximally mixed active slab, with raster- y measurements and no feedback. (a) Total entropy $S(t)/N_y$. (b) Column entropy $s_x(t)/N_y$, summed over y and the two orbitals, at $x = 5, 10, 15$. Colors and markers identify columns; solid and dashed curves identify $\alpha_1 = 1, 3$, respectively. All 161 cycles are shown with logarithmic entropy and linear rescaled time. No averaging, fits, or uncertainty bars are applied. The $\alpha_1 = 3$ near-zero tails are roundoff-limited.
