

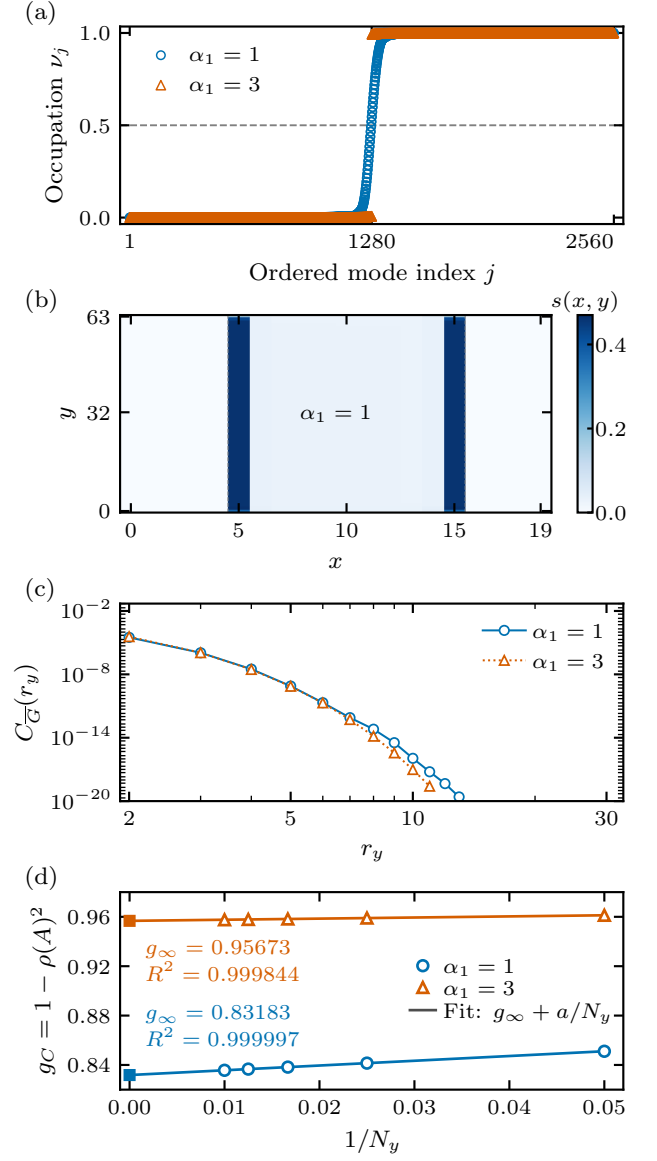

FIG. 1. Outcome-averaged hard-wall channel. (a) Endpoint occupation spectra for $\alpha_1 = 1, 3$. (b) Full-system entropy contour $s(x, y)$ for $\alpha_1 = 1$, in nats per unit cell. (c) Squared averaged correlator. Panels (a)–(c) use the untwirled endpoints at cycle 128, starting from maximal mixing, with $N_x = 20$, $N_y = 64$ and $n_{\text{shell}} = 1$; outcomes are averaged analytically. (d) Channel gap $g_C = 1 - \rho(A)^2$ at fixed $N_x = 20$ and varying N_y ; lines are the saved $g_\infty + a/N_y$ fits. This caption is for layout assessment only.
